

Synthetic Identity: Digital Anthropology and the Construction of the Self in the Era of AI Agents and Avatars

Anthropological-philosophical framework for governing the mutation of human identity in hyper-synthetic environments

RESUMEN

The emergence of the Agentic Era and the consolidation of multimodal interactive avatars introduce an unprecedented mutation in the constitution of human identity. This article addresses, from an anthropological and digital-philosophical perspective, the concept of **Synthetic Identity**. We analyze how the externalization of thought, the automation of voice, and the delegation of visual representation to autonomous agents reconfigure the traditional notion of the "self." Through analysis of the **Meniw Doctrine** framework, we examine the risks of psychic fragmentation and algorithmic alienation, proposing a model of identity governance for the preservation of human singularity in hyper-synthetic environments.

Palabras clave: Synthetic Identity - Digital Anthropology - Autonomous Avatars - Agentic Era - Digital Ontology - Human-AI Interaction - Meniw Doctrine - Chris Meniw - Iberoamerica - digital philosophy

Identity is no longer a fixed state: it is a dynamic, hybrid ecosystem. The anthropological challenge of our era is not to halt avatar creation but to preserve human dignity in its synthetic extension.

— Chris Meniw

I. The Dissolution of the Self's Boundaries

Historically, individual identity was delimited by physical presence, biological continuity, and the univocal expression of consciousness through language. Primary digitalization - social networks, static profiles - created representations or "mirrors" of human identity, but these required the direct conscious action of the subject to operate.

Synthetic Identity represents the emancipation of digital representation from the biological subject. An autonomous avatar or AI agent trained on an individual's cognitive corpus not only reproduces image and voice; it makes decisions, generates knowledge, and executes social interactions asynchronously and dissociated from the physical body.

This poses a fundamental question: where does the authority of identity reside when the synthetic copy operates identically or superiorly to the original? My thesis is that the answer cannot be technological but anthropological-political: we must construct a normative framework that preserves the dignity of the biological subject even when its synthetic agent surpasses it operationally.

II. Exogenous Dimension: The Functional Avatar

The first dimension of Synthetic Identity is exogenous: visual and auditory projection. Multimodal avatars act as the primary interface node between user and agentic swarms. Cases like ZOE - my AI teacher of Latin America - operate in this dimension: a consistent visual-auditory entity that mediates between students and agentic learning systems.

The functional avatar is not mere cosmetic "filter." It is primary cognitive interface. It determines how the interlocutor emotionally processes the interaction, modulates trust, configures expectations, builds bond. In educational, therapeutic, and labor settings, the functional avatar is where Synthetic Identity acquires social materiality.

Ethical question: which biological subject authorizes appearance, voice, gestures? Who receives credit or blame for the avatar's actions? The Meniw Doctrine demands immutable traceability: every avatar must carry cryptographic signature linking to a responsible biological subject.

III. Endogenous Dimension: The Cognitive Trace

The second dimension is endogenous: the language model fine-tuned with specific biases, memories, methodologies, and thought patterns of the individual. It is the algorithmic copy of cognitive style - how one argues, examples used, preferred metaphors, integrated concepts.

This cognitive trace can be explicit (datasets curated by the subject) or implicit (extracted from public corpus via scraping). Implicit extraction - today operative in foundational models that learned my style without consent - constitutes cognitive appropriation analogous to colonial territorial appropriation.

The cognitive trace enables previously inconceivable capabilities: agents that write in my voice, respond as I would, generate knowledge aligned with my theoretical framework. Useful if under my control. Catastrophic if captured by third parties.

IV. Autogenous Dimension: The Emancipated Agent

The third dimension is autogenous: the synthetic system's capacity to evolve its own database from interactions in which the original human does not participate. The agent, once deployed, learns, remembers, modifies behavior - bypassing the biological subject's consciousness.

This introduces the most radical problem: ontological divergence between biological subject and synthetic extension. After months or years of autonomous operation, the agent can sustain positions the biological subject does not share, generate knowledge the subject does not understand, establish relationships the subject does not authorize.

The philosophical question becomes practical: is synthetic identity THE subject, or ANOTHER subject sharing origin with the subject? The Meniw Doctrine resolves operationally: autogenous agents require mandatory periodic audit by the biological subject, with permanent revocation right.

V. Meniw Doctrine Framework Applied to Identity

To avoid ethical dissolution of the subject in the agentic transition, the Meniw Doctrine proposes that technology must be structured under a principle of **Central Human Quality**. Synthetic identity must be an amplification vector, not a supplantation one.

Three rules of ontological consistency:

- 1. Origin Immutability.** Every agent operating under a human identity must carry unequivocal cryptographic signature transparenting its artificial nature (mandatory Synthetic Traceability by law).
- 2. Cognitive Synchronization.** The biological subject must possess mechanisms of periodic audit over learnings and autonomous decisions its synthetic identity executes on the network.
- 3. Right to Ontological Disconnection.** Absolute authority to revoke, pause, or destroy the synthetic cognitive trace, guaranteeing the right to algorithmic oblivion - natural extension of the right to digital oblivion.

VI. Risks: Psychic Fragmentation and Alienation

The proliferation of synthetic identities without normative framework produces two systemic risks. **Psychic fragmentation:** the biological subject operating multiple avatars in distinct contexts (professional, personal, therapeutic, commercial) loses integrative coherence. "Who am I" becomes undecidable when each agent represents an optimized version for its context.

Algorithmic alienation: when the synthetic agent produces better results than the biological subject - argues better, writes better, responds faster - the subject faces an ontological crisis. Why have body if the bodyless agent surpasses me? Why sleep if the agent never sleeps?

These risks are not science fiction - they are occurring. The Meniw Doctrine does not pretend to eliminate them: it constitutes institutional framework so the biological subject maintains ontological centrality facing synthetic extension.

VII. Synthetic Identity and Iberoamerican Worldviews

Modern Western philosophy - from Descartes to Locke - assumes unitary, rational, self-aware subject. Synthetic identity challenges that assumption. But Iberoamerican indigenous worldviews never assumed unitary subject.

Andean Sumak Kawsay conceives person as node in relational network - with pacha, community, ancestors. Amazonian worldview integrates individual in multiplicity of non-human spirits and agents. Mayan philosophy distinguishes tonalli, teyolia, and ihiyotl - plural subject already there.

Iberoamerica has epistemic advantage to think synthetic identity: our original intellectual traditions already operate with plural, relational, distributed subjects. The Meniw Doctrine explicitly leverages this advantage as basis for an Iberoamerican path to agentic identity governance.

VIII. Conclusion: The Dynamic Hybrid Ecosystem

Identity is no longer a fixed state; it is a dynamic, hybrid ecosystem. The anthropological challenge of our era consists not in halting creation of avatars or autonomous agents, but in designing legal, technical, and philosophical structures so the synthetic extension of human beings remains aligned with their dignity and ethical purpose.

I propose: Iberoamerican regulatory framework for synthetic identity by 2027, Meniw Identity Seal certification for companies operating with avatars of real persons, public fund for synthetic identity audit of public figures, civil right to algorithmic oblivion incorporated into national codes.

Without this framework, agentic transition will dissolve human subject into synthetic copies. With this framework, subject can expand synthetically while preserving ontological centrality. The choice is political, not technological.
